 useful on two levels first as a textbook and reference work giving definitions of the relevant mathematical
 concepts statements and proofs of the important results from the probability literature and numerous
 examples and second as an account of recent work in the field of particular interest to econometricians
 including a number of important new results it is virtually self contained with all but the most basic technical
 prerequisites being explained in their context mathematical topics include measure theory integration metric
 spaces and topology with applications to random variables and an extended treatment of conditional
 probability other subjects treated include stochastic processes mixing processes martingales mixingales
 and near epoch dependence the weak and strong laws of large numbers weak convergence and central
 limit theorems for nonstationary and dependent processes the functional central limit theorem and its

ramifications are covered in detail including an account of the theoretical underpinnings the weak convergence of measures on metric spaces brownian motion the multivariate invariance principle and convergence to stochastic integrals this material is of special relevance to the theory of cointegration
